ACDSee Photo Studio Professional 2027 pairs serious editing power with industry-leading organization to match. Generative AI Tools let you dream up entirely new imagery and reimagine existing shots, while non-destructive RAW editing gives you full control over color, light, and detail without ever touching your original. New Auto-Stack and Stacking tools bring order to collections of any size, grouping photos by GPS location, capture time, or visual likeness — and the new AI Image Similarity engine takes it further, powering AI Reverse Image Search to find any shot by sight alone. Whatever you shoot, however you edit, ACDSee keeps your archive sharp, searchable, and full of possibility.

NEW Generative AI

AI Image Generation • Generative Fill • Generative Edit • AI Remove

NEW Auto-Stack

Point ACDSee at a folder and let it find the groups for you. Automatically stack by GPS location, capture time, image similarity, or any combination of the three. Tune the thresholds to match how you shoot — tighter for a fast burst, looser for a day-long shoot. Save your settings as a preset and apply them to a new folder with a keyboard shortcut. Grouping by location or capture time takes seconds, even on a folder of thousands of frames.

NEW Custom Stacking

Some groupings only make sense to you. Group the frames you're choosing between, and keep the whole set on hand while you decide. Group by your own reasoning — a bracket set, a series, a client's picks. Rearrange a stack whenever you want, and put the frame you care about on top.

NEW AI Reverse Image Search

Some photos are easier to recognize than to describe. As you browse your folders, AI Image Similarity quietly compares your photos by how they look — no tagging, no keywords, no setup. Then select any image and let AI Reverse Image Search find every visually related shot. It's the fastest way to track down every frame from a series, every photo of a place, or every shot that just looks right.

NEW Group By AI Image Similarity

The enhanced Group By tool now includes Group By AI Image Similarity, clustering visually related photos so patterns, near-duplicates, and hidden favorites rise to the surface. Use it on a single folder, a handful of folders, or the results of a search — combine it with an AI Keyword search to narrow a broad set down to exactly the images you want. It's a new lens on a collection you thought you already knew.

... and so much more!
